Lecture Notes, March 28, 2011

General Equilibrium Theory
Market-clearing prices and allocation of several goods, taking into account cross-market interactions.
Existence of Equilibrium
(Pareto) Efficiency of Allocation
Decentralization of decision-making

The Edgeworth Box
2 person, 2 good, pure exchange economy

Fixed positive quantities of X and Y, and two households, 1 and 2.

Household 1 is endowed with \( \bar{X}^1 \) of good X and \( \bar{Y}^1 \) of good Y, utility function \( U^1(X^1, Y^1) \). Household 2 is endowed with \( \bar{X}^2 \) of good X and \( \bar{Y}^2 \) of good Y, utility function \( U^2(X^2, Y^2) \)

\[
X^1 + X^2 = \bar{X}^1 + \bar{X}^2 \equiv \bar{X},
\]
\[
Y^1 + Y^2 = \bar{Y}^1 + \bar{Y}^2 \equiv \bar{Y}.
\]

Each point in the Edgeworth box represents an attainable choice of \( X^1 \) and \( X^2 \), \( Y^1 \) and \( Y^2 \).

1's origin is at the southwest corner; 1's consumption increases as the allocation point moves in a northeast direction; 2's increases as the allocation point moves in a southwest direction. Superimpose indifference curves on the Edgeworth Box.

Competitive Equilibrium
\( (p^o_x, p^o_y) \) so that \( (X^o_1, Y^o_1) \) maximizes \( U^1(X^1, Y^1) \) subject to
\[
(p^o_x, p^o_y) \cdot (X^1, Y^1) \leq (p^o_x, p^o_y) \cdot (\bar{X}^1, \bar{Y}^1) \text{ and }
\]
\( (X^o_2, Y^o_2) \) maximizes \( U^2(X^2, Y^2) \) subject to
\[
(p^o_x, p^o_y) \cdot (X^1, Y^1) \leq (p^o_x, p^o_y) \cdot (\bar{X}^2, \bar{Y}^2), \text{ and }
\]
\( (X^o_1, Y^o_1) + (X^o_2, Y^o_2) = (X^1, Y^1) + (X^2, Y^2) \)
or \( (X^o_1, Y^o_1) + (X^o_2, Y^o_2) \leq (\bar{X}^1, \bar{Y}^1) + (\bar{X}^2, \bar{Y}^2) \), where the inequality holds co-ordinatewise and any good for which there is a strict inequality has a price of 0.

Pareto efficiency:
An allocation is Pareto efficient if all of the opportunities for mutually desirable reallocation have been fully used. The allocation is Pareto efficient if there is no available reallocation that can improve the utility level of one household while not reducing the utility of any household.

Tangency of 1 and 2's indifference curves: Pareto efficient allocations.

Pareto efficient allocation:
(X₀¹, Y₀¹), (X₀², Y₀²) maximizes

U¹(X¹, Y¹) subject to

U²(X², Y²) ≥ U₀² (typically equality will hold and U₀² = U²(X₀², Y₀²)) and subject to the resource constraints

X¹ + X² = X ≡ X
Y¹ + Y² = Y ≡ Y.

Equivalently, X² = X - X¹, Y² = Y - Y¹

Solving for Pareto efficiency (Assuming differentiability and an interior solution):

Lagrangian

L = U¹(X¹, Y¹) + λ[U²(X - X¹, Y - Y¹) - U₀²]

\[ \frac{\partial L}{\partial X¹} = \frac{\partial U¹}{\partial X¹} - \lambda \frac{\partial U²}{\partial X²} = 0 \]

\[ \frac{\partial L}{\partial Y¹} = \frac{\partial U¹}{\partial Y¹} - \lambda \frac{\partial U²}{\partial Y²} = 0 \]

\[ \frac{\partial L}{\partial \lambda} = U²(X², Y²) - U₀² = 0 \]

This gives us then the condition

\[ \text{MRS}¹_{x,y} = \frac{\frac{\partial U¹}{\partial X¹}}{\frac{\partial U¹}{\partial Y¹}} = \frac{\frac{\partial U²}{\partial X²}}{\frac{\partial U²}{\partial Y²}} = \text{MRS}²_{x,y} \] or equivalently

March 28, 2011
\[ \text{MRS}^1_{xy} = \frac{\partial Y^1}{\partial X^1} \bigg|_{U^1=\text{constant}} = \frac{\partial Y^2}{\partial X^2} \bigg|_{U^2=\text{constant}} = \text{MRS}^2_{xy} \]

Pareto efficient allocation in the Edgeworth box: the slope of 2's indifference curve at an efficient allocation will equal the slope of 1's indifference curve; the points of tangency of the two curves.

*contract curve* = individually rational Pareto efficient points

**Market allocation**

\[ p^x, p^y \]

Household 1: Choose \( X^1, Y^1 \), to maximize \( U^1(X^1, Y^1) \) subject to

\[ p^x X^1 + p^y Y^1 = B^1 \]

budget constraint is a straight line passing through the endowment point \((\bar{X}^1, \bar{Y}^1)\) with slope \( \frac{p^x}{p^y} \).

**Lagrangian**

\[ L = U^1(X^1, Y^1) - \lambda [p^x X^1 + p^y Y^1 - B^1] \]

\[ \frac{\partial L}{\partial X} = \frac{\partial U^1}{\partial X^1} - \lambda p^x = 0 \]

\[ \frac{\partial L}{\partial Y} = \frac{\partial U^1}{\partial Y^1} - \lambda p^y = 0 \]

Therefore, at the utility optimum subject to budget constraint we have

\[ \text{MRS}^1_{xy} = \frac{\frac{\partial U^1}{\partial X^1}}{\frac{\partial U^1}{\partial Y^1}} = \frac{p^x}{p^y}; \text{ Similarly for household 2,} \]

\[ \text{MRS}^2_{xy} = \frac{\frac{\partial U^2}{\partial X^2}}{\frac{\partial U^2}{\partial Y^2}} = \frac{p^x}{p^y}. \]
Equilibrium prices: $p^x$ and $p^y$ so that
\[ X^*1 + X^*2 = \overline{X}^1 + \overline{X}^2 \equiv \overline{X} \]
\[ Y^*1 + Y^*2 = \overline{Y}^1 + \overline{Y}^2 \equiv \overline{Y} \]
(market clearing)

where $X^*_i$ and $Y^*_i$, $i = 1, 2$, are utility maximizing mix of $X$ and $Y$ at prices $p^x$ and $p^y$.

\[- \frac{\partial Y^1}{\partial X^1} \bigg|_{U^1=U^1} = \frac{\partial U^1}{\partial U^1} = p^x \]
\[- \frac{\partial U^2}{\partial U^2} = - \frac{\partial Y^2}{\partial X^2} \bigg|_{U^2=U^2} \]

The price system decentralizes the efficient allocation decision.
