### The Arrow-Debreu Model of General Competitive Equilibrium

#### The Market, Commodities and Prices

N commodities

$x = (x_1, x_2, x_3, \dots, x_N) \in \mathbf{R}^N$ , a commodity bundle

The market takes place at a single instant, prior to the rest of economic activity.

**commodity** = good or service completely specified

description

location

date (of delivery)

A futures market: no reopening of trade.

**Price system** :  $p = (p_1, p_2, \dots, p_N) \neq 0$ .

$p_i \geq 0$  for all  $i = 1, \dots, N$ .

Value of a bundle  $x \in \mathbf{R}^N$  at prices  $p$  is  $p \cdot x$ .

#### Firms and Production Technology

$F$ ,  $j \in F$ ,  $j = 1, \dots, \#F$ .

Production technology:  $\mathcal{Y}^j \subset \mathbf{R}^N$ .  $y \in \mathcal{Y}^j$  (the script Y notation is to emphasize that  $\mathcal{Y}^j$  is bounded).

Negative co-ordinates of  $y$  are inputs; positive co-ordinates are outputs.

$y \in \mathcal{Y}^j$ ,  $y = (-2, -3, 0, 0, 1)$

This is a more general specification than a production function. The relationship is

$f^j(x) \equiv \max \{ w \mid (-x, w) \in \mathcal{Y}^j \}$ .

#### The Form of Production Technology

P.II.  $0 \in \mathcal{Y}^j$ .

P.III.  $\mathcal{Y}^j$  is closed. (continuity)

P.VI  $\mathcal{Y}^j$  is a bounded set for each  $j \in F$ . (We'll dispense with this eventually)

P.III and P.VI  $\Rightarrow \mathcal{Y}^j$  is compact

Compactness of  $\mathcal{Y}^j$  is needed to be sure that profit maximization is well-defined, but P.VI is an ugly assumption: boundedness of a firm's attainable production possibilities should be communicated by the price system --- not by assumption. Chapter 15 of Starr's book weakens the assumption by showing that --- even when the firm's technology set is unbounded --- under weak assumptions, the set of attainable plans is bounded. Then circumscribe the unbounded technology set by a ball strictly containing the attainable plans. Apply the analysis of chaps. 11 - 14 to the artificially circumscribed production technology --- there will be an equilibrium (theorem 14.1) and an equilibrium is necessarily attainable, so the circumscribing ball is not a binding constraint in equilibrium. Then delete the artificial circumscribing ball; the prices and allocation remain an equilibrium. Conclusion: P.VI can be eliminated but it's a complex pain to do so.

### Strictly Convex Production Technology

P.V. For each  $j \in F$ ,  $\mathcal{Y}^j$  is strictly convex.

Convexity implies no scale economies, no indivisibilities.

$p \in R_+^N$ ,  $p = (p_1, p_2, \dots, p_N)$ ,  $p \neq 0$ .

$\tilde{S}^j(p) \equiv \{y^{*j} \mid y^{*j} \in \mathcal{Y}^j, p \cdot y^{*j} \geq p \cdot y \text{ for all } y \in \mathcal{Y}^j\}$ .

**Theorem 11.1:** Assume P.II, P.III, P.V, and P.VI. Let  $p \in R_+^N, p \neq 0$ . Then  $\tilde{S}^j(p)$  is a well defined continuous point-valued function.

#### Proof:

Well defined:  $\tilde{S}^j(p)$  = maximizer of a continuous real-valued function on a compact set.

Point-valued: Strict convexity of  $\mathcal{Y}^j$ , P.V. Point valued-ness implies that  $\tilde{S}^j(p)$  is a function.

Continuity: Let  $p^v \in R_+^N; v = 1, 2, \dots; p^v \neq 0, p^v \rightarrow p^o \neq 0$ . Show  $\tilde{S}^j(p^v) \rightarrow \tilde{S}^j(p^o)$ .

Note: this is a consequence of the Maximum Theorem (see Berge, *Topological Spaces*), but we can provide a direct proof here, by contradiction. Suppose not. Then there is a cluster point of the sequence  $\tilde{S}^j(p^v)$ ,  $y^*$  so that  $y^* \neq \tilde{S}(p^o)$  and  $p^o \cdot \tilde{S}^j(p^o) > p^o \cdot y^*$  (why does this inequality hold? by definition of  $\tilde{S}^j(p^o)$ ). That is there is a subsequence  $p^v$  so that  $\tilde{S}^j(p^v) \rightarrow y^*$ . Note that  $p^v \cdot \tilde{S}^j(p^o) \rightarrow p^o \cdot \tilde{S}^j(p^o)$ . We have  $p^v \cdot \tilde{S}^j(p^v) \rightarrow p^o \cdot y^*$  and  $p^o \cdot \tilde{S}^j(p^o) > p^o \cdot y^*$ . But the dot product is a continuous function of its arguments, so for  $v$  large,  $p^v \cdot \tilde{S}^j(p^o) > p^v \cdot \tilde{S}^j(p^v)$ , a contradiction. Hence  $\tilde{S}^j(p^v) \rightarrow \tilde{S}^j(p^o)$ . Q.E.D.

**Lemma 1:** (homogeneity of degree 0) Assume P.II, P.III, and P.VI. Let  $\lambda > 0$ ,  $p \in R_+^N$ . Then  $\tilde{S}^j(\lambda p) = \tilde{S}^j(p)$ .

$$\tilde{S}(p) \equiv \sum_{j \in F} \tilde{S}^j(p)$$

#### 4.4 Attainable Production Plans

**Definition:** A sum of sets  $\mathcal{Y}^j$  in  $R^N$ , is defined as  $\mathcal{Y} = \sum_j \mathcal{Y}^j$  is the set

$$\{y \mid y = \sum_j y^j \text{ for some } y^j \in \mathcal{Y}^j\}.$$

Aggregate technology set:

$$\mathcal{Y} \equiv \sum_{j \in F} \mathcal{Y}^j.$$

Initial inputs to production  $r \in R_+^N$

**Definition:** Let  $y \in \mathcal{Y}$ . Then  $y$  is said to be attainable if  $y + r \geq 0$ .

$$y \in \mathcal{Y} \text{ is attainable if } (y + r) \in [\mathcal{Y} + \{r\}] \cap R_+^N.$$

Note that under this definition, and P.II, P.III, P.V, P.VI the attainable set of outputs is compact and convex.
