

Everyone is endowed with 100 tokens.

You can allocate tokens between two accounts.

Tokens in the **Private Account** earn you 1 point per token. No one else earns any points from tokens you put in the Private Account.

Tokens in the **Class Account** will earn points for you and all the other students here today. All tokens placed in the Class Account by all the students will be pooled together. We will then double the tokens in the public account, divide this new total by the number of students in the class and give each student that many points. For example, suppose there were only three students and they put 0, 20, and 100 tokens respectively into the Class Account. This sums to 120 tokens. We multiply that by 2 for a total of 240. We then divide that by 3 to get  $240/3 = 80$ . Then we give all three students 80 points. These points will be in addition to the points they earn from the Private Account.

How many of your tokens do you want to put in the Private Account and how many in the Class Account? NOTE: Private Account + Class Account = 100
